Experiment No.4

1. Title:

Use function types, scope, and closures; apply try-catch; build a palindrome checker.

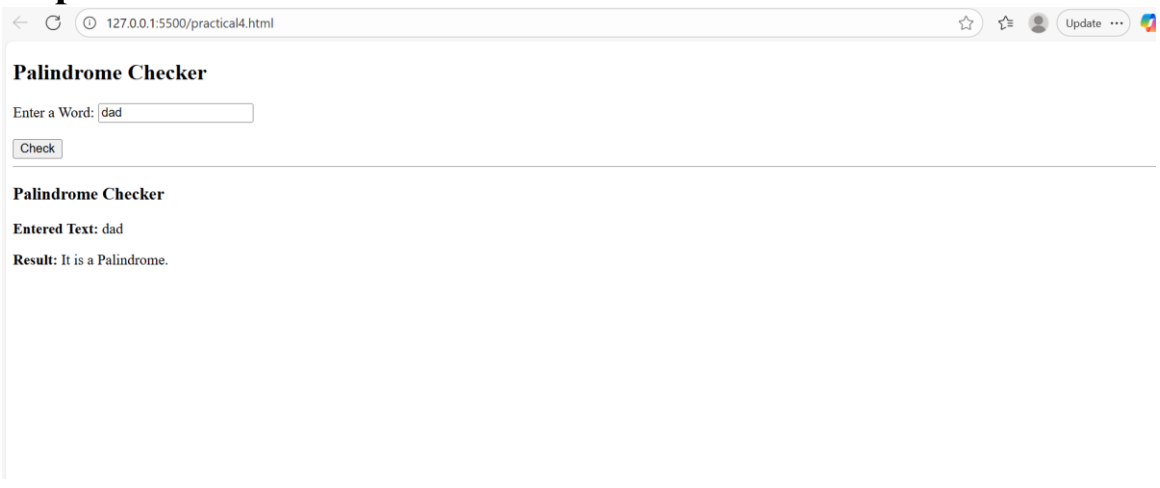

2.Software/Tools Required:

- Visual Studio Code (VS Code)
- HTML5
- JavaScript (ES6)
- Google Chrome / Microsoft Edge

3.Theory:

JavaScript provides different types of functions such as normal functions, function expressions, and arrow functions to perform specific tasks. Variable scope determines the accessibility of variables within a program, while closures allow a function to access variables from its outer scope even after the outer function has finished execution. The try...catch statement is used for exception handling to prevent the program from crashing due to runtime errors. In this experiment, these concepts are demonstrated by developing a palindrome checker that validates user input and determines whether the entered text is a palindrome.

4.Output:

5.Result/Conclusion:

This experiment helped in understanding different function types, variable scope, closures, and exception handling in JavaScript. It also demonstrated how these concepts can be used to validate user input and build a simple palindrome checker.
